SUBJECT: THE CURRENT LAPALMA SITUATION AND THE TRUE DANGER TO THE USA

La Palma volcano opens a new mouth as 3.8 magnitude earthquake rocks the island forcing fresh evacuations – amid warnings of poison gas cloud when lava reaches the ocean TODAY !!!!!

- Magnitude 3.8 earthquake hit La Palma overnight, as volcano opened new mouth 900m north of the old one
- That has forced fresh evacuations in Tacande region, bringing the total number of people evacuated to 6,000

- **Lava due to reach the ocean today where it will produce a cloud of poison gas, as police set up exclusion zone**
- **166 homes have been destroyed so-far along with 250 acres of land including farms, but no injuries reported**

Millions of gallons of lava belched out of the ground is now snaking its way towards the island's west coast where it is expected to drop into the ocean today - creating a toxic cloud of hydrochloric acid laced with fine glass particles that form when the molten rock is rapidly cooled.

Police have set up an exclusion zone to prevent people from getting too close to the cloud, stretching from the tourist resort of Puerto Naos in the south to Playa Vina in the north and heading two nautical miles out to sea.

TO HELP PUT THIS INTO PERSPECTIVE HERE ARE SOME COMPARISONS:

Volcanoes also release mind-boggling quantities of energy, though usually not quite on the scale of hurricanes (thankfully for those who live near!). But if we look at a well-known major volcanic eruption, the eruption of Mount St. Helens in 1980, we find that: "In all, Mount St. Helens released 24 megatons of thermal energy, 7 of which was a direct result of the blast. This is equivalent to 1,600 times the size of the atomic bomb dropped on Hiroshima" (U.S. Geological Survey).

But Mount St. Helens wasn't even at the top of the scale of [Volcanic Explosivity Index](#). It was a class 5, and the scale goes up all the way to 8, which are called "mega-colossal" eruptions. These class 8 super-volcanos erupt extremely rarely (otherwise we wouldn't be here), but when they do, more than 1,000 cubic kilometers of rock and ash are ejected, the climate of the whole planet is affected for extended periods of time, and mass-extinctions can be expected. Now that is powerful! To get anywhere close to that kind of energy release, the U.S. and Russia would have to use their entire nuclear arsenals simultaneously, and even that might not be enough to compare depending on how long the volcanic eruption lasts.

Additionally the tonnage of rocks being dumped into the ocean will be increased and enhanced by the advanced earthquake producing systems of Russia!!! It is estimated that with the additional push from the Russian earthquake system that a MINIMUM of 3 trillion tons of rocks and dirt will be pushed into the Atlantic ocean in less than 5 minutes... So, stay alert and stay safe!

Now we get to the technical details:

1. How do we know and expect a more violent eruption in the very near future ?
 - 1.1.THERE WERE 7 VENTS THAT MAGMA WAS FLOWING OUT OF NOW A NEW VENT OPENED UP AND THE MAGMA FLOW IN ALL THE OTHER VENTS THE MAGMA STARTED FLOWING FASTER.
 - 1.2.AT THE SAME TIME THE EXISTING BULGE ON THE SECTION OF ROCK THAT COULD EASILY FALL INTO THE OCEAN CONTINUES TO BULGE OUT MORE
 - 1.3.ADDITIONALLY THERE ARE HIGH LEVELS OF SULPHUR GAS STREAMING OUT FROM THE VOLCANO AND HAVE BEEN DETECTED AT 60,000 FEETS ABOVE THE VOLCANO. (NOTE: IT IS A PROVEN FACT THAT HIGH LEVELS OF SULPHUR GAS ENISSIONS FROM AN ERUPTING VOLCANO ARE A SURE SIGN OF A LARGER AND MORE EXPLOSIVE ERUPTION TO FOLLOW IN THE NEAR FUTURE.
2. HOW DO WE VERIFY THESE FACTS ?
 - 2.1.THE HIGH LEVELS OF SULPHER GAS AND THE SLIPPAGE OF THE ENTIRE ROCK FACE AND THE BULGING ARE MEASURED REGULARLY BY HIGH FLYING RECONNAISSANCE PLANES WHICH ARE NOW FLYING 24/7 OVER THE ISLAND, AND THEY HAVE THE FOLLOWING SENSORS AMONG OTHER THINGS:
 - 2.1.1. A SPECIAL FILM CAMERA WHICH CAN CLEARLY READ 2 POINT TYPE USING ONLY MOONLIGHT AND SPECIAL FILM YIELDS THE FOLLOWING INFORMATION:
 - 2.1.1.1. THE RESULTS OF THE IMAGES SHOW STEADY SLIPPAGE OF THE ROCK FACE TRAVELING DOWNWARD TO THE OCEAN SO FAR IT HAS SLIPPED DOWNWARD MORE THAN 16 CENTIMETERS IN A FEW DAYS WHICH IS ALMOST UNHEARD OF.
 - 2.1.1.2. THE SIDE OF THE MOUNTAIN FACING NORTH AMERICA IS BULGING MORE EACH DAY AT AN INCREASING RATE OF 5 CENTIMETERS PER DAY WHICH IS

ALMOST UNHEARD OF UNLESS IT IS PREPARING TO FALL INTO THE OCEAN !!.

2.1.2. THE PLANES ALSO HAVE GAS SENSORS WHICH PROVE THAT THE SULPHUR BLOOM ALREADY REACHES AS HIGH AS 60,000 FEET. THIS TELLS THE STORY THAT A MASSIVE ERUPTION IS STILL EXPECTED WITH THE CURRENT ONGOING EVENT.

2.1.3. ADDITIONALLY THE INFRARED VIEW OF THE ROCK FACE SHOWS IT IS HEATING RAPIDLY AND THAT MEANS IT WILL BE MUCH MORE EXPLOSIVE WHEN THE ROCKS AND EARTH HIT THE OCEAN.

2.2. SEVERAL GROUPS OF GEOLOGISTS ALL SAY THE SAME THING ABOUT A BIGGER ERUPTION AND MORE VIOLENT EARTHQUAKES. THEY ALL SAID EXPECT A BIGGER ERUPTION MOST LIKELY WITHIN THE NEXT 2 WEEKS...

**GOD BLESS YOU AND KEEP YOU ALL SAFE IN THESE TIMES
SCIENCE GUY**
